

## Game Programming: Exercise 5: Pong - Math exercise (2 pages)

Learning objectives	<ul style="list-style-type: none"><li>• Using the library GLM to solve problems using vectors and matrices</li><li>• Implementing a matrix, which transforms an object from a local coordinate system to a global (aka. world) coordinate system.</li></ul> <p>Note: When starting the exercise you only see an empty black screen!</p> <p>Final game: <a href="http://www.itu.dk/~mnob/pong/Pong.html">http://www.itu.dk/~mnob/pong/Pong.html</a></p>
Exercise 5.1	<p><b>Implement transform</b></p> <ul style="list-style-type: none"><li>• The application starts with a black screen, you need to apply the transformations so that the objects are visible to the virtual camera.</li><li>• Implement <code>Box::getTransform()</code> and <code>Ball::getTransform()</code>. Both methods should create a matrix which transform from the object coordinate frame to the world coordinate frame using translate (position) and scale.</li><li>• Note that <code>scale.z</code> must be fixed to 0.1f</li><li>• When implemented correctly the following level should appear:</li></ul> 
Exercise 5.2	<p><b>Move paddles and ball</b></p> <ul style="list-style-type: none"><li>• Implement <code>Pong::movePaddle(paddle, yDelta)</code>, where the position of the paddle is moved <code>yDelta</code>. Use <code>glm::clamp</code> to ensure that the paddle does not penetrate the top and bottom bars.</li><li>• Implement <code>Ball::move()</code>, which should change the ball position based on velocity and delta time.</li></ul>

<p><b>Exercise 5.3</b></p> 	<p><b>Implement physics</b></p> <ul style="list-style-type: none"> <li>• Collisions <ul style="list-style-type: none"> <li>○ To simulate physics, you need to test if the ball (a circle) collides with an edge (line segment) by implementing the <code>Pong::hasCollision(Edge2D edge)</code>. <ul style="list-style-type: none"> <li>▪ Hint: you can use <code>glm::closestPointOnLine()</code></li> </ul> </li> <li>○ Handle collisions by implementing the missing code in <code>Point::handleCollision(Box* paddle)</code>. If the angle between the edge normal and the ball's velocity is less than 90 degrees, then assume no collision (this solves problems where the ball gets stuck in boundary). <ul style="list-style-type: none"> <li>▪ Hint: What vector operation help you find the angle between two vectors?</li> </ul> </li> </ul> </li> <li>• Out of bounds <ul style="list-style-type: none"> <li>○ Implement <code>Pong::handleOutOfBounds()</code>: if ball move out of screen increase the score of the other player and relaunch the ball using <code>resetBall(bool)</code></li> </ul> </li> </ul>
<p><b>Exercise 5.4</b></p>	<p>Breakout challenge (Extra - just for fun)</p> <ul style="list-style-type: none"> <li>• You are probably tired of making pong games, so modify the code to make a breakout game!</li> </ul>
